

My career began in software testing, where I learned that quality isn't something you verify at the end of a project — it's something you design into the product from the beginning. Over the years, I expanded into test automation, test management, test data management, environment management, cloud transformation, and software engineering.

Today I build modern web applications while applying the same engineering discipline used in enterprise environments. My goal is simple: create software that is scalable, maintainable, thoroughly tested, and ready for production.

## About me

I enjoy solving complex technical challenges and turning ideas into high-quality software products.

With several years of experience in enterprise software delivery, I understand both the technical and organisational aspects of building reliable systems. I work comfortably across development, testing, cloud infrastructure, automation, and product delivery.

Whether I'm developing a SaaS platform, designing a test strategy, or introducing modern testing practices for enterprise teams, I focus on long-term maintainability rather than short-term fixes.

## What I do

Enterprise delivery depth meets hands-on product engineering — one integrated quality mindset.

## Full Stack Development

I design and develop modern web applications from concept to production – frontend, backend architecture, authentication, databases, payments, deployment, and automated testing. I enjoy building products that are fast, intuitive, and easy to maintain.

## Quality Engineering

Quality is not a separate phase of development. It influences architecture, code quality, testing, deployment, and maintenance. Every project I build includes clean architecture, automated testing, CI, continuous improvement, and production-ready deployment.

## Test Automation

Automation has been part of my daily work throughout my career. I build reliable frameworks that help teams deliver faster while reducing manual effort and release risk – covering E2E, API, integration, UI, and regression testing with Playwright, Selenium, Vitest, and CI/CD.

## Test Data Management

Reliable software depends on reliable test data. I help establish enterprise-wide strategies for managing test data across applications and environments – including lifecycle management, database refresh concepts, pseudo-production environments, governance, and AWS-based approaches.

## Test Environment Management

Modern delivery depends on stable environments. I coordinate enterprise test environments across teams and help ensure testing can be performed reliably – covering

planning, readiness, release preparation, deployment coordination, risk assessment, and cloud-based delivery support.

## Experience

### MULTI-YEAR · AGILE ENTERPRISE DELIVERY

#### Test Manager · Test Data Manager · Test Environment Manager

Swiss Life · Enterprise CRM & Digital Platforms

Working within large agile delivery organisations, I help ensure software can be delivered with confidence, quality, and predictable releases. Responsibilities have expanded from traditional QA into enterprise-wide quality engineering and delivery management.

- Lead enterprise test management, quality engineering, and risk-based test strategy across complex CRM and digital platforms.
- Drive Playwright automation, API testing, and integration testing as part of release readiness.
- Own test data management: lifecycle, refresh concepts, pseudo-production environments, governance, and cross-team coordination.
- Coordinate test environments, deployment readiness, and release preparation across multiple Scrum teams.
- Support AWS cloud transformation and cloud-native delivery together with product, engineering, and architecture stakeholders.
- Improve processes continuously so quality becomes a shared delivery signal — not a late gate.

### ONGOING

#### Independent Software Engineer

Freelance / Projects · Web products & SaaS

Alongside enterprise work, I develop modern web applications and SaaS products from idea to production — combining software engineering with enterprise quality engineering.

- Own end-to-end delivery: architecture, frontend/backend, authentication, databases, payments, and deployment.
- Ship production products such as NavisSedes (ticketing) and Seatly (reservations) with Next.js, Prisma, and cloud data layers.
- Build automated testing and CI/CD into the delivery process from day one.
- Optimise for maintainability, performance, and a clear product experience.

## Selected projects

### NavisSedes

[Case study ↗](#)

A complete event ticketing platform for churches and cultural organisations – interactive seating, Stripe payments, QR tickets, reservations, role-based admin, and check-in workflows.

Interactive seating plans

Stripe checkout

QR tickets & email confirmations

Role-based administration

Automated testing

Next.js · TypeScript · Prisma · PostgreSQL · Neon · Stripe · Playwright · Vitest · Cloudflare

### Seatly

[Open ↗](#)

A restaurant reservation platform demonstrating modern full-stack architecture with auth, search, booking persistence, and automated testing.

Authentication & sessions

Restaurant search

Reservation workflow

Database persistence

CI Playwright coverage

Next.js · TypeScript · Prisma · Neon · JWT · Playwright

### Playwright Automation Suite

[Open ↗](#)

An enterprise-inspired automation framework using modern testing practices — built as a shippable engineering artifact, not ad-hoc scripts.

Page Object Model

HTML reporting

Reusable architecture

Parallel execution

CI-ready workflows

Playwright · TypeScript · POM · CI

## Elikuren

Open ↗

Modern choir website with a secure member platform — public presence, protected member area, media library, and administration.

Public website

Protected member area

Authentication

Media library & admin

Responsive design

Next.js · React · TypeScript · Tailwind

## Technical expertise

### Languages

TypeScript

JavaScript

Python

Java

### Frontend

React

Next.js

Tailwind CSS

shadcn/ui

### Backend

Node.js

Next.js

Prisma

PostgreSQL

REST APIs

JWT Auth

### Testing & Quality

Playwright

Selenium

Vitest

API Testing

E2E Testing

Test Strategy

Test Data Management

Test Environment Management

### Cloud & DevOps

## How I work

The best software comes from combining engineering excellence with a strong quality mindset. Rather than separating development and testing, I integrate both into one engineering process.

01 Understanding the business problem

02 Designing scalable architectures

03 Building maintainable software

04 Automating testing from the beginning

05 Deploying continuously

06 Monitoring and improving over time

This approach results in software that is easier to maintain, easier to scale, and more reliable for users.

## Let's build reliable software

Whether you need a modern web application, enterprise quality engineering, automated testing, or someone who can bridge development and quality assurance — I'd be happy to hear about your project.

**Software engineering with quality built in — not added later.**
